Research Interests

I apply tools from Formal Methods and Programming Languages to construct, certify, and give formal semantics to secure systems. I am particularly interested in reasoning about security for cryptographic mechanisms used in practice. Broadly, I am interested in applied cryptography, distributed systems, type systems, compiler correctness, proof assistants, and formal methods. I have published in **IEEE S&P, POPL, CCS, PLDI,** and **PETS**.

Education

- **Ph.D. in Computer Science**. Cornell University. December 2021.
  - Co-advised by Elaine Shi and Greg Morrisett. Thesis: Equational Reasoning for Verified Cryptographic Security.
- **B.A. in Mathematics**. Reed College. May 2016.
  - Thesis: Fully Homomorphic Encryption.

Experience and Appointments

- **Postdoctoral Fellow**. Carnegie Mellon University. 2021 - Present.
  - Advised by Bryan Parno. Research Focus: Type systems for secure cryptographic protocols.
- **Amazon Automated Reasoning Group**. Software Engineering Intern. Summer 2019.
  - Delivered formal proofs and specifications for Amazon Encryption SDK
  - Created a compiler from internal protocol description language to Dafny
- **Galois, Inc.** Software Engineering/Research Intern. Summer 2017.
  - Worked with Air Force Research Lab to migrate codebase to Rust
  - Extended Crucible symbolic execution engine to handle Rust

Professional Activities: Program Committees: FCS 2020, FC 2023, SPLASH SRC 2023;
External/Shadow Reviewer for CCS 2017, CSF 2020, CCS 2021, POPL 2024

Teaching: Reed College Thesis Advisor, 2022-2023; TA for CS 3410 (Computer System Organization and Programming); TA for CS 4120 (Introduction to Compilers)

Professional Service: PhD Admissions Volunteer for Cornell, 2019

Publications

- **Secure Synthesis of Distributed Cryptographic Applications**.
  To appear at CSF 2024.
  Cosku Acay, Joshua Gancher, Rolph Recto, and Andrew Myers.
- **OWL: Compositional Verification of Security Protocols via an Information-Flow Type System**.
  IEEE S&P 2023.
  Joshua Gancher, Sydney Gibson, Pratap Singh, Samvid Dharanikota, and Bryan Parno.

- **A Core Calculus for Equational Proofs of Cryptographic Protocols**.
  POPL 2023.
  Joshua Gancher, Kristina Sojakova, Xiong Fan, Elaine Shi, and Greg Morrisett.
- **Viaduct: An Extensible, Optimizing Compiler for Secure Distributed Programs**.
  PLDI 2021.
  Coşku Acay, Rolph Recto, Joshua Gancher, Andrew Myers, and Elaine Shi.
- **Symbolic Proofs for Lattice-Based Cryptography**.
  CCS 2018.
  Gilles Barthe, Xiong Fan, Joshua Gancher, Benjamin Grégoire, Charlie Jacomme and Elaine Shi.
- **Externally Verifiable Oblivious RAM**.
  PETS 2017.
  Joshua Gancher, Adam Groce, and Alex Ledger.

Funding

- **NSF: SatC: CORE: Small: Automating the End-to-End Verification of Security Protocol Implementations.** 2022.
  Award # 2224279. Award size: $600,000. PIs: Bryan Parno and Joshua Gancher.
  Advancing the state of the art in modular, highly automated, end-to-end formal proofs for security protocols.

Invited Talks

- IETF 118, November 2023: Owl: New Directions for Security Protocol Analysis
- CyLab Partners Conference 2023: Verifying Security Protocols End-to-End with Owl
- CMU Crypto Seminar, September 2023: Owl: Compositional Verification of Security Protocols
- CMU PoP Seminar, September 2023: Owl: Compositional Verification of Security Protocols
- INRIA Prosecco Seminar, June 2023: Owl: Compositional Verification of Security Protocols
- Boston University POPV Seminar, April 2023: Owl: Compositional Verification of Security Protocols via an Information-Flow Type System
- Galois Tech Talk, March 2023: End-to-End Verification for Security Protocols
- Stanford Software Research Lunch, November 2022: A Core Calculus for Equational Proofs of Cryptographic Protocols
- New England Systems Verification Day 2022: End-to-End Verification for Security Protocols
- PLCrypt Workshop, May 2022: End-to-End Verification for Security Protocols in F*
- New England Systems Verification Day 2019: IPDL: Proving Compositional Security of Cryptographic Protocols
